**DESCRIPTION**

Roulette as an alternative game on a game machine.

This Utility Model refers to a roulette mounted as an alternative game on a game machine to provide an added attraction for players, allowing them to increase their chances of winning by playing in another area or in another way without having to move from where they placed previous bets.

Most amateur and even professional gamblers are extremely superstitious and, after a losing streak, decide to improve their luck by changing location or at least by changing games in an attempt to beat the odds. Therefore a new attraction has been incorporated into standard game machines by adding an actual working roulette wheel that can be played as an alternative to the game of the machine on which it is installed or, in certain cases, as a supplementary game of the aforementioned machine.

This is achieved by placing a roulette wheel with a horizontal, inclined, or even vertical axis on the front panel of the machine. The roulette wheel, divided into numbers, colors or symbols is driven by a small motor that is activated separately from the other game(s) as a part of a pre-established program that links or subordinates it to the other game(s) that make(s) up the assembly of the game machine in which it is installed.

In order to better understand the scope of this invention, following is a description based on the drawings of the attached page, showing an illustrative, non-restrictive example of the same.

In the drawings:

Figure 1 shows a front view of a normal game machine on which the roulette has been installed pursuant to this invention, and

figure 2 shows front and side views of the

2

roulette in a schematic presentation, as adapted to the game machine.

The drawing illustrates how, using a panel that can be viewed by the player, a working roulette (2) is adapted to the panel. The roulette's probe (3) is an elastic spring that indicates and marks the prize on the face of the roulette wheel (2) when the wheel stops spinning, coming to a stop on one of the numbered colored sections that indicate the prize.

The wheel (2), which spins on a horizontal, inclined or even vertical axis, depending on the panel to which it is attached; has, in the separations of each section, a contact (4) in the form of a small perpendicular peg, which the probe or spring hits when the wheel (2) spins, driven by the motor (5) activated by the player, separate from the game(s) of the machine or following a pre-established game plan in which the roulette wheel could be used as a supplementary game to the main game of the machine.

Logically, in the case of a separate game, the entire assembly will be activated by the coin assembly under the same conditions as for the alternative game of the machine, and with the same startup operations, alternatives, and positions.

There are various possible variations to the details of the invention, also protected: The roulette wheel divisions could vary, as well as the type of contacts or passes corresponding to each division, the type of probe or spring used to mark and indicate the value of the winning section, the means used to propel the wheel and, of course, the sizes, graphics, and position of each component.

This Utility Model is defined in the claims indicated below.

**CLAIMS**

1. Roulette as an alternative game on a game machine, characterized by a spinning wheel divided into numbered colored sections corresponding to the prize, which moves on a horizontal, inclined or vertical axis, depending on the panel or position on the machine on which it is installed, with pegs or contacts in

4

each separation, near the perimeter, which a probe or spring touches successively, which in turn indicates the prize won. The aforementioned roulette wheel spins, driven by a motor that is activated according to the game plan, and stops according to the same.

2. Roulette as an alternative game on a game machine.

## DESCRIPTION

Roulette as an alternative game on a game machine.

This Utility Model refers to a roulette mounted as an alternative game on a game machine to provide an added attraction for players, allowing them to increase their chances of winning by playing in another area or in another way without having to move from where they placed previous bets.

Most amateur and even professional gamblers are extremely superstitious and, after a losing streak, decide to improve their luck by changing location or at least by changing games in an attempt to beat the odds. Therefore a new attraction has been incorporated into standard game machines by adding an actual working roulette wheel that can be played as an alternative to the game of the machine on which it is installed or, in certain cases, as a supplementary game of the aforementioned machine.

This is achieved by placing a roulette wheel with a horizontal, inclined, or even vertical axis on the front panel of the machine. The roulette wheel, divided into numbers, colors or symbols is driven by a small motor that is activated separately from the other game(s) as a part of a pre-established program that links or subordinates it to the other game(s) that make(s) up the assembly of the game machine in which it is installed.

In order to better understand the scope of this invention, following is a description based on the drawings of the attached page, showing an illustrative, non-restrictive example of the same.

In the drawings:

Figure 1 shows a front view of a normal game machine on which the roulette has been installed pursuant to this invention, and

figure 2 shows front and side views of the

2

roulette in a schematic presentation, as adapted to the game machine.

The drawing illustrates how, using a panel that can be viewed by the player, a working roulette (2) is adapted to the panel. The roulette's probe (3) is an elastic spring that indicates and marks the prize on the face of the roulette wheel (2) when the wheel stops spinning, coming to a stop on one of the numbered colored sections that indicate the prize.

The wheel (2), which spins on a horizontal, inclined or even vertical axis, depending on the panel to which it is attached; has, in the separations of each section, a contact (4) in the form of a small perpendicular peg, which the probe or spring hits when the wheel (2) spins, driven by the motor (5) activated by the player, separate from the game(s) of the machine or following a pre-established game plan in which the roulette wheel could be used as a supplementary game to the main game of the machine.

Logically, in the case of a separate game, the entire assembly will be activated by the coin assembly under the same conditions as for the alternative game of the machine, and with the same startup operations, alternatives, and positions.

There are various possible variations to the details of the invention, also protected: The roulette wheel divisions could vary, as well as the type of contacts or passes corresponding to each division, the type of probe or spring used to mark and indicate the value of the winning section, the means used to propel the wheel and, of course, the sizes, graphics, and position of each component.

This Utility Model is defined in the claims indicated below.
